

Small and medium-sized businesses are requiring cash infusion — fast. But how will the world's banks dole out massive government relief funds? Intelligent automation processing relief loans can speed up every step of the process.

\$760 B

Businesses around the world are applying for trillions in disaster relief funds. The U.S. and U.K. governments alone will dole out \$760 billion.

The problem

In the spring of 2019, governments around the globe made trillions of dollars available to businesses through loans. The United States Congress dedicated \$350 billion to companies with less than 500 employees. The U.K. set aside £330 billion for any company making less than £45 million. Germany is rolling out loans up to €800,000 each.

Making those funds readily available is another matter. Even the world's largest banks are scrambling to build online loan application portals compatible with government systems. Moreover, applying for loans is a manual process, but our Al-driven platform will reduce those long hours for large or small banks. So what allows intelligent automation processing relief loans to be so quick and efficient?

The solution

Automation Hero uses a combination of Al-powered document classification, data extraction, advanced OCR (optical character recognition), and NLP (natural language processing) for handwriting to reduce manual tasks and process loans more accurately and quickly.

Use AI to classify

In the early phases of loan origination, we can help banks build a document classification model that makes quick work of the intake and application processes. For example: What type of document is attached to a potential borrower's email? Our platform uses Al to sort a huge range of unstructured data, such as proof-of-identity documents, trade licenses, and founding or tax certificates.

Extract data

Then, depending on the document type, we establish rules for extracting pieces of data from it. Is a tax ID number always in the upper-right corner of the document? For German or French auto licenses, are the photos on the lower left? Our platform uses deep learning as a guide.

Decipher handwritten documents

Here's how it works

Finally, Automation Hero uses its advanced OCR to analyze data that's structured, semi-structured, or unstructured. It does so with unparalleled accuracy. To be sure, most OCR software can parse big volumes of documents -- as long as those only include machine-typed text. Our platform has proved particularly versatile around OCR involving a combination of machine-typed text and human handwriting. We use domain-specific training data for our OCR solution, meaning the platform focuses on a narrower sphere of information. In the end, our solution is much better equipped to accurately interpret problem cases and unusually messy handwriting.

Make it attended or unattended

A bank can decide whether these tasks are attended or unattended automations. If attended, updates and problem cases will be served up on a regular basis for human review by Automation Hero's personal automation assistant, Robin.

About Automation Hero

Automation Hero helps organizations process any type of document faster than ever with the most powerful and complete intelligent document processing platform. It offers the easiest-to-use and most accurate Al in the industry so companies can instead focus on accelerating business processes to stay competitive. Our award-winning intelligent document processing platform: lets you get up and running within minutes, provides value within hours, and is future-proof for years to come. Connect with any IT infrastructure, click together no-code workflows with the industry's most accurate Al, seamlessly integrate your workforce into the process, and get real-time insights.

Benefits of Automation Hero for loan processing

- Speed up screening and sorting of application documents
- Extract and compile data from scanned documents for database input or e-signature
- Reduce input errors
- Build a model for faster credit scoring and underwriting
- Approve loans in seconds
- Streamline auditing and reporting
- Simplify compliance
- Create seamless back-end integrations with government software
- Incorporate attended automations so bank staff can review problem cases
