

Flow Studio:

# A new way to automate workflows

## **No code required**

---

Build end-to-end flows with a few easy clicks.

Flow Studio is the heart of the Automation Hero platform, the place where a user automates a workflow.

What you bring to Flow Studio as inputs could be data from a wide range of sources inside your company. Flow Studio has an extensive pre-built connector library. We also support connecting to your systems via API. You then choose from hundreds of drag-and-drop functions, which let you perform actions or include calculations using your specified data. Functions can be customized for your company and shared among teams. Using your connected data sources and functions, you can then author an end-to-end automation, or a flow.

Flow Studio leverages sophisticated AI techniques to parse data that's either structured and unstructured, from sources either on-premise or off, letting users build automations that solve complex problems — no code necessary.

### **Pull in more data**

Flow Studio lets you connect to a wide variety of data sources, including cloud-based applications, databases (either structured or unstructured) and legacy data.

### **Try an API**

Use an applications REST API to access data or edit the information in the database.

## Decisions in real time

Run processes in parallel that support real-time decision-making.

### Customizable outputs

Any user can add an output, or several of them, in Flow Studio, depending on the desired outcome of your workflow or task. You can also use our personal automation assistant, Robin, to keep humans in the loop as these tasks are completed.

### Make real-time decisions

Run processes in parallel that allow information to stream continuously across the platform and support real-time decision-making.

### Add AI

Once you've built an automation in Flow Studio, you can easily move right into an automation by bringing trained AI models into the flow with a few clicks.

### Set notifications

As you build a flow, you can design notifications and route them, depending on your organizational needs. You can also monitor systems through smart logs in our environment, or connect to your own external logging system.

### Track effectiveness

Is your automation running effectively? You can balance compute power and monitor back pressure.

---

## What is Automation Hero?

Automation Hero's end-to-end automation platform for the modern enterprise combines screen scraping, structured and unstructured data processing, machine learning, and the human workforce. It's an operating system for automation — intelligently automating everything from simple tasks to complex business processes. This improves information worker productivity and drives more successful, optimized business outcomes. Its powerful backend focuses on three key areas: eliminating repetitive and time-consuming tasks, automating common asks and augmenting employee decision making.
